

EDA ARM ASSEMBLY

OVERVIEW

There are multiple applications for the EDA Arm Assembly, such as cameras, detectors, solar panels, or a signal assembly. With no loose parts and no welded joints, this device is a one-piece arm construction and there is no assembly required.

The unique nipple design simplifies head installation. There are locking features of the octagonal nuts (with a set screw) to prevent unfastening of the nut caused by vibration.

The EDA Arm Assembly is made of primary grade aluminum alloy for maximum strength, corrosion resistance and ductility.

FEATURES—EDA ARM ASSEMBLY

- Strong one-piece design
- Single or double arm application
- No assembly required
- Available up to 34" lengths
- Allows for multi-way configurations
- Easy access to wiring channel allows for maintenance without removing arms from pole
